

AccouZen

CARE FOR WOMEN WITH VIRTUAL REALITY TOOLS

BENEFICES

- Easy to handle
- Several scenarios available
- Continuity in the sessions
- Assisted operation (manual)
- Preset scenario (automatic)

MOTS CLEFS

- Maternity
- Anxiety
- Tokophobia
- Therapeutic tool
- Virtual Reality

THERAPEUTIC CARE FOR WOMEN SUFFERING FROM CHILDBIRTH-RELATED TRAUMA

In 2016 847.100 babies were born in France. Childbirth is often the mother's first hospitalization. In 30% of cases, women report having experienced a traumatic situation, and in 5% of cases, they develop a Post-Traumatic Stress Disorder. This impacts approximately 42,000 women per year. These women experience a disturbed attachment to the child, complicated breastfeeding and/or difficulties in their sexuality.

THERAPY

AccouZen is a tool for therapeutic care based on the principle of graduated in virtuo exposure. The virtual reality software allows a progressive immersion in different 3D scenarios related to delivery situations in a hospital. Accompanied by therapeutic know-how, the available scenarios allow the professional to gradually expose his patient in an adapted and controlled environment.

MATURITY

- The tool was tested with a healthy cohort.
- A clinical study is currently underway.

APPLICATIONS

Use of the method and the tool dedicated to perinatal professionals in the care of women, in particular maternity and liberal psychologists.
