#MedicalDevice

The MAMAN medical device allows for securing the pressures exerted on the fetal head using connected forceps. These forceps are used to control the baby's exit trajectories as well as the pressure exerted on the newborn's head.

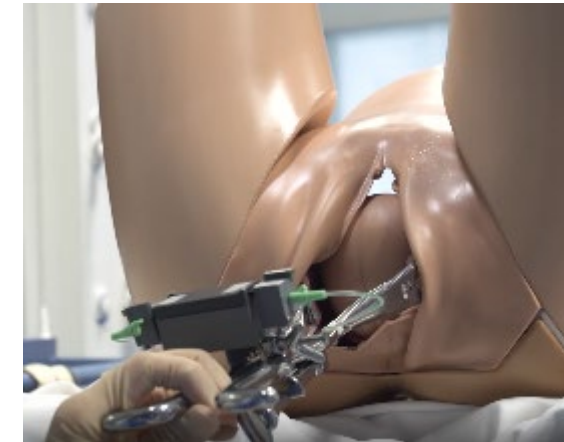

The prototype was tested on a model by various obstetricians.

A virtual reality software was developed to carry out the training.

Possible applications:

- Forceps training
- Securing the use of forceps during delivery

- MAMAN is an innovative Ivd/MD to manipulate and protect the fetal head using forceps connected during delivery.
